

Boring Lad Tells of Prize Trip

Rudolph Mullenhoff Had Interesting Time at Agricultural College With Other Leaders of Boys' and Girls' Industrial Club.

(By Rudolph Mullenhoff.)

BORING, Ore., Aug. 31.—(Special.)—I left home Sunday, June 18, and boarded the Southern Pacific train at Clackamas station, arriving at Corvallis at 2:30. I was met and conducted to Cuthbert Hall by State Agent H. C. Seymour and H. F. Aker, who showed me my room.

After I had unpacked my things and made my bed, I went out to view the campus, and got acquainted with the other boys. When supper time came we were all taken to Waldo hall to eat our first meal at Corvallis.

The next morning we were called at 6 o'clock and went to breakfast at 6:45. Each morning at 8 o'clock a lecture was given us in the agricultural building, which lasted about 45 minutes. One of the lectures given was: "The Good of Industrial Clubs," by State Agent H. C. Seymour. We were all highly pleased with what he said about the work of the industrial clubs and what they are to do for Oregon boys and girls. President W. J. Kerr, of the Oregon Agricultural college, also gave us an interesting lecture on industrial club work.

O. M. Plummer, of the Portland Union stockyards, gave us an interesting lecture on "A Noble Character." He spoke wonderful words and told us always to remember the following: "Always be a gentleman or a gentlewoman. Never fail to acknowledge a kind act, either by word of mouth or by letter. Kind words are as diamonds—they increase in value with age—they are also more or less rare. A soft answer turneth away wrath." Governor Withycombe made a special trip to the college to give us boys and girls a lecture. He gave us a very interesting lecture on "Betterment of Farm Life," also a lecture on "Farm Life Only Natural Life." We were all very interested with what he said, I am sure, for it was very instructive.

A very instructive lecture was given by Mr. Ackerman of the normal school at Monmouth. Mr. Ackerman requested us to remember three things which were: First, figure out what you want to do; second, make up your mind to do it; third, stick to it.

Numerous other lectures which were interesting were given by Director E. D. Kessler, Director R. D. Hessel, Assistant State Superintendent E. F. Carleton, Miss H. J. Cowgill, Professor L. J. Allen, state pig club agent, N. C. Maris, and L. P. Harrington, industrial field workers.

After the lectures each morning, the girls were given courses in home economics in the new home economics building and the boys were given courses in agriculture which were conducted in the open fields, orchards, gardens, greenhouses, barns, shops and laboratories. Miss Cowgill was the supervisor of the girls and Mr. Ager the supervisor of the boys.

Nine to a quarter of eleven each morning was spent in studying hog breeds, feeding animals, horse judging, sheep judging, hog judging, farm machinery, gas engines, gardening and common fruits. The instruction was

given by members of the faculty of the Oregon Agricultural college. One subject was studied each day.

At 12 o'clock each day we had dinner at Waldo hall where all our meals were served. In the afternoon, from 1:30 to 2:30 o'clock studies of milch cows, feeding dairy cows, poultry feeding, hatching, and care of breeds, were given by professors of the college; also a study of insects and bees.

The rest of the afternoon we had for sports, playing baseball, tennis, basketball, or whatever we wanted to do. Sometimes we would explore the college buildings or the town or the college farm, asking Mr. Aker for permission before leaving the campus.

At 5 o'clock each evening we could swim or bathe in the Shepard hall pool for 45 minutes, then we had supper at 6 o'clock.

After supper we went to moving picture shows, or entertainments or parties held in gymnasium, Waldo hall or Cuthbert hall.

Thursday evening, June 28, a banquet was given to all state prize winners of the industrial club by N. C. Maris and L. P. Harrington, industrial field workers. There were 20 state prize winners in all, eight girls and 12 boys. President W. J. Kerr, of the Oregon Agricultural college, Director E. D. Kessler, Assistant State Superintendent E. F. Carleton, State Leader of Club Work H. C. Seymour and Mrs. Seymour, State Pig Club Agent L. J. Allen, Assistant Leader of Club Work Miss Cowgill, H. F. Aker and Mrs. Honny were also invited to the banquet. N. C. Maris was toastmaster. We had a splendid supper and a very joyous time.

Saturday, June 24, was planned for an outing trip, but later it was decided to go to Philomath to the "Round-up," because some of the boys wanted to. So we went to Philomath, which was about six miles from Corvallis. We made the trip in three automobiles. Sunday many of us spent visiting friends.

Friday evening, June 30, I left for home, after saying goodbye and thanking all; for I enjoyed the two weeks at the college very much.

I won my trip in the following way: I got interested in the industrial club movement organized in our district in 1914. Enrolled for some of the projects because I thought it to be a very helpful, progressive and educational movement for boys and girls.

That year I won an "achievement emblem" for completing a project and exhibiting same at state fair. The next year, 1915, I again enrolled for some of the projects, completing two and exhibiting them at state fair. I then won this trip to the Oregon Agricultural College in the boys' and girls' school camp for two weeks in June, 1916, in the seed grain project, division 2, in which I was required to grow one acre or more of grain. I raised 2 31-160 acres of bluestem wheat, then hand select the heads in the field just before cutting grain, and then wrote a report of grain raised, how I handled, selected my grain, etc.

Guardmen to Return Home. WASHINGTON, Aug. 30.—Orders for the return to their state mobilization camps of 15,000 National Guardsmen now on the Mexican border were issued by the war department tonight.

General Funston was directed to return three regiments from New York, two from New Jersey, two from Illinois, two from Missouri and one each from California, Oregon, Washington and Louisiana.

Lone Man Robs Bank. SAN FRANCISCO, Aug. 30.—A man who gave his name as Jack Evans, of Chicago, held up a branch of the Anglo-California bank here today and obtained \$8,000 in gold and currency. He fled in a commandeered automobile pursued by Emil Sutter, bank teller, and the chauffeur drove him into the park police station five miles away where he was captured with the money.

The robbery occurred in a densely populated section. The robber forced Sutter to turn over the \$8,000 and held the teller at bay until he landed in a jitney bus at the curb.

ON THE FARM AND GARDEN

ALFALFA WEEVIL IS FOUND IN NORTHWEST

SPREAD OF INSECT SLOWER THAN FEARED, BUT HAS BEEN STEADY.

The alfalfa weevil is spreading in a way which makes it possible that sooner or later every section of the country will have to consider the problem of guarding against this pest. During the 12 years since the weevil was introduced into America it has been confined to the limits of the Great Basin of the West, but it has been found this year by the Bureau of Entomology at Malaga, California, and Blackfoot, Idaho, all within the Snake River drainage system, and at Duchesne, Utah, in the Colorado River system, which, like that of the Snake, slopes to the Pacific.

A description of the alfalfa weevil and methods of combating its ravages are contained in a new publication of the department Farmers Bulletin 741. The spread of the pest has, as a matter of fact, been slower than was at one time feared, but its progress has been steady. In Utah and in small portions of Idaho and Wyoming, where it now exists, it has caused at times a loss of 50 per cent of the first cutting of alfalfa and a total loss of the second cutting.

The weevil is most easily discovered in the form of the full-grown larva. It is then a green worm-like creature one-fourth of an inch long, with a black head and a faint white stripe down the middle of the back. It feeds upon the leaves of alfalfa mainly during late May, June, and early July and may be found by sweeping the tops of the plants with an insect net or by looking for the notches in the leaves where it has fed. When the larvae are numerous they destroy most of the tender growth and cause the tops to appear white, making the field look as if frost-bitten when viewed from a distance.

The adult insect is an oval, brown beetle three-sixteenths of an inch long, with a prominent snout. Its color frequently is nearly black. This beetle is harder to discover than the larva, but, on the other hand, it is present in the field the whole year around. In winter it can be found by digging about the crowns and roots of alfalfa plants. One efficacious method of controlling the pest therefore is to destroy the eggs by pasturing the first crop up to that time. A similar result may be obtained by cutting the alfalfa green and feeding it as a soil-incubator.

If this is not done, the larvae hatch in large numbers about the last week of May, or earlier, and eat the alfalfa leaves so rapidly that the plant is unable to outgrow the injury. After the field is cut the larvae which have been feeding upon the first crop gather upon the buds of the stubble and frequently consume all of the second crop. By that time most of the insects have completed their growing period and have gone into the pupal or resting stage. The later growth of the crop therefore does not suffer from them.

To protect the crop, pasturing, as has been said, is effective in the early part of the season. The field should be divided into two or three lots, and each lot should be pastured alternately the animals being left in it until the alfalfa has been eaten down close to the ground.

20 CASES ARE SET IN THE CIRCUIT COURT

SEPTEMBER TO BE BUSY MONTH AT COURTHOUSE—OCTOBER CALENDAR CLEAR.

September will be a busy month at the courthouse. Besides tax collecting, which will soon be at full swing, the circuit court calendar has been filled. Twenty cases are set for the month, and the jury will be in for two or three weeks.

The cases set up to Wednesday night are:

September 5—Robinson vs. Linton; Southwest Motorcar company vs. Robbins, demurrer; Cummins vs. S. L. and T. Cummins.

September 6—Harding vs. Young. September 7—Clarke vs. Willamette Valley Southern.

September 8—Thompson vs. Brissich. September 9—Kreuder vs. Rissley. September 11—Martin vs. Tortow.

September 12—Willamette Valley Southern vs. Clark.

September 13—Somers vs. Harvey. September 14—Hedgale vs. Brown. September 15—West vs. Hedges.

September 16—Fellows vs. Kerbs et al.

September 18—Hoskins vs. Clackamas county.

September 19—Spencer vs. Barnes. September 20—Settlemier vs. Cole. September 25—Irvin vs. Donaldson.

September 27—Adkins vs. Foster et al.

September 28—McFall vs. McFall. September 30—Morgan vs. First State Bank of Gresham.

Judge Bagley, of Hillsboro, will be here September 18, but Judge Campbell will be on the bench all other days next month. No cases have been set in October.

Chamberlain's Colic, Cholera and Diarrhoea Remedy.

This is a medicine that every family should be provided with. Colic and diarrhoea often come on suddenly and it is of the greatest importance that they be treated promptly. Consider the suffering that must be endured until a physician arrives or medicine can be obtained. Chamberlain's Colic, Cholera and Diarrhoea Remedy has a reputation second to none for the quick relief which it affords. Obtainable

CORN IN VALLEY THIS YEAR IS BACKWARD

O. A. C. EXPERT TELLS HOW TO SAVE CROP, IF FROST BIT—TEN, FOR SILAGE.

Some farmers are becoming alarmed over the prospects for silage corn for the Willamette valley this year. The season has been backward from the planting time almost constantly throughout the summer until late August. As a result, some fields of corn, especially those planted with the large-growing, late-maturing, so-called "silage" varieties of the eastern states are exceedingly backward and do not show promise of reaching the best stage for going into the silo.

"That stage," says G. R. Hyslop, crop specialist at O. A. C., "is when the corn has reached maturity, the husks beginning to dry and the corn itself in the hard dough stage, the kernels well dented and glazed. At this stage, and before the corn has dried out, it may be cut into the silage without the addition of water, and this makes the very best of corn silage."

"If it has been frosted or has seriously dried out, water must be added to make up for that loss and to help keep air out of the silage."

"Corn may be successfully stored in the silo at considerably less mature stages if it becomes necessary to do so in order to save the crop. Even when the ears are in the milk the corn makes very good silage, except that it is rather sour and watery and usually not quite so much can be fed as when the ripen corn is used. It may also be successfully stored even before the ears have reached the roasting stage or the milk stage. In such case, no water should be added and it is sometimes advantageous to let so green corn wilt to some extent before cutting it into the silo in order to avoid an excess of water. Such silage does not have as much feeding value or substance to it as corn which is put in at a more mature stage but it is well worth storing in the silo and feeding to the stock."

"Seasons like this emphasize more than ever the importance of choosing an early to medium-maturing variety of corn for silage purposes. One that will mature a good ear in the average season, is the variety to use for silage in Oregon. Minnesota No. 13 and others of the medium maturing varieties are proving especially valuable for that purpose this year."

Birch, Larch and Fir. The birch grows farther north than any other tree. Next comes the Siberian larch and then the fir.

TWO EXPLOITED CROPS THAT FAIL IN OREGON

A campaign is again on to induce Oregon farmers to purchase two highly exploited crops that usually fail to meet expectation—the Titanic wheat, closely related to a similar sort known as the Alaska wheat, and Eureka clover, which is not a clover at all, but a salsaline regarded in Japan simply as a weed.

"Eureka Clover is not a clover in any sense," says Professor G. R. Hyslop, specialist in Crop Production at O. A. C. "It is a member of the smart weed family and does not possess the clover attribute of gathering nitrogen from the air to store in the soil. It has been tried out in numerous experiment stations and so far as the records show has never been continued as a forage crop. It produces considerable quantities of forage but this is not readily eaten by the stock even when offered frequently. It is not drought resistant but is rather easily killed by frost and is slow in becoming established. After it once gains a foothold, however, it is almost impossible to eradicate."

BENEFITS TO DRAINAGE.

Removing excess water in drainage enables crops to root more deeply, producing a larger soil layer in which to store usable or capillary soil moisture. It causes the soil to become more mellow and pliable. It encourages aeration by emptying the large porous spaces which are filled with water, making room for soil aeration. By drying soil out early in the spring it makes the soil warmer. It firms the soil and lengthens the growing season so that the whole field can be worked early. The air provided by drainage assists decay, nitrification and liberation of plant food. It prevents erosion by making the soil more absorptive. It prevents the eating or freezing out of clover or grain on wet lands or rise of alkali on irrigated lands. Drainage improves sanitary conditions, aids transportation and highway improvement and helps develop the country in general. It increases crop yields and land values and is one of the most permanent improvements that can be put on land.

From Drainage of White Lands and Other Wet Lands in Oregon, issued by the O. A. C. Experiment Station. Free copies on request.

Eight Boys in Shugrue Family. Joe Shugrue, the Jersey City (N. J.) pugilist, has seven younger brothers.

They Do, Indeed. "What kind of leather makes the best shoes?" "Don't know, but banana skins make good slippers."

Sharks' Teeth. A shark's teeth are movable at will and become erect at the moment the animal is seizing its prey.

Are You Looking Old? Old age comes quick enough without inviting it. Some look old at forty. That is because they neglect the liver and bowels. Keep your bowels regular and your liver healthy and you will not only feel younger but look younger. When troubled with constipation or biliousness take Chamberlain's Tablets. They are intended especially for these ailments and are excellent. Easy to take and most agreeable in effect. Obtainable everywhere.—Adv.

FEED COW LIBERALLY FOR PROFIT, IS ADVICE

DEPARTMENT OF AGRICULTURE IN NEW BULLETIN RECOMMENDS GOOD PASTURE.

One of the most common mistakes in the feeding of dairy cows on the farm is that the good cows are not given a sufficient quantity of food above that required for their physical maintenance to obtain the maximum quantity of milk they are capable of producing. Successful feeding of dairy cows involves the providing of an abundant supply of palatable, nutritious feed at a minimum cost and feeding in such a way as to receive the largest milk production from the feed consumed. Feeding for profit is defined as liberal feeding, or feeding to the full capacity of the cow, in a new Farmers' Bulletin of the department, No. 742, The Feeding of Dairy Cows, which discusses many of the factors involved in economical feeding.

From the standpoint of economical milk production, a dairy cow generally should not be fed more than she will consume without gaining in weight. There are times, however, according to the bulletin, when it is desirable to make exceptions to this rule. Practically all heavy milk producers lose weight in the early part of their lactation period; that is, they produce milk at the expense of their body flesh. When such cows approach the end of their milking period they normally regain the flesh they have lost, and the farmer can well afford to feed them liberally, with the assurance that he will be paid in the form of milk when the cows again freshen.

Pasture is the natural feed for cows, and for average conditions, with ample pasture of good grasses or legumes in good, succulent condition, good production can be secured.

The cost of land is a factor in the economy of using pasture, however. If pastures are depended upon entirely for from four to six months of the year, and production is kept up to a profitable standard, anywhere from 1 to 4 acres or more must be provided for each cow, says the bulletin.

Birch, Larch and Fir. The birch grows farther north than any other tree. Next comes the Siberian larch and then the fir.

Aconite And Black Hemp, Both Poison, Used As Medicine

One hundred grains of aconite form five doses for a horse. It is enough to kill several men of the ordinary variety, yet James Partlow, of this city, will take 100 grains into his system when he feels slightly indisposed, and live to tell about it. In fact, he has been taking aconite and black hemp, about as deadly, at more or less regular intervals for the last 15 or 20 years and says now that he is a better man physically than ever before in his life.

Mr. Partlow, who is 57 years old, has a novel theory of the cause of disease and the cure thereof. He declares that all diseases are caused by defective heart action—if the heart beat is too rapid, certain diseases are always present; if it is too slow, other ailments are present. For instance, dandruff, he claims, is caused by too much blood in the scalp. The heart action is too rapid and forces too much blood throughout the body. A feverish condition is produced in the scalp and dandruff results. On the other hand, certain diseases of the stomach may be produced by too slow heart action and not enough blood in the stomach to enable that organ to perform its proper functions.

For all these diseases, Mr. Partlow has two medicines. Aconite speeds up the heart and black hemp slows it down. First he finds out in investigating a case, how the heart action

is. If the action is too slow, he administers aconite; if it is too fast he gives black hemp, and, he reasons, the patient is as certain to be cured as the drug is to bring the heart to normal action.

Mr. Partlow has explained his theory of medicine to many in Oregon City and several have tried it out. Several cures have been reported, but Mr. Partlow remains the principal champion as well as the originator of the theory.

"I've burned up tons of doctors' books," he declares. "I've found that all human ailments center about the action of the heart and when the heart is properly regulated, the disease will disappear."

That aconite and black hemp are both poisons seem not to worry him.

Oregon City physicians have been interested in Mr. Partlow's theory for several years. They are inclined to attribute his ability to take large quantities of the poisons into his system without ill effect to the fact that he has taken them for years and his body has been hardened against their effect.

By calling Mr. Partlow is the proprietor of a peanut and popcorn wagon, although he inherited from his parents, well known Oregon pioneers, rich and valuable farm lands near the city limits.

BORING MINISTER TO MAKE ALASKA HIS HOME

REV. MR. HATCH WILL TAKE REV. C. M. BROWN'S PLACE—ENTERTAINMENT SUCCESS.

BORING, Ore., Aug. 29.—Rev. C. M. Brown, pastor of the Boring-Pleasant Home Methodist church, liked Alaska so well when he visited that territory on his vacation this summer that he decided to make Alaska his home. Mrs. Brown and their four children will leave this week for Alaska to join him.

Rev. Mr. Hatch, who was substituting for Rev. Mr. Brown during his

absence, has been appointed permanent pastor.

The entertainment given at the Methodist church last Saturday evening under the auspices of the Sunday school, netted \$44. An amusing feature of the evening was a contest to decide by popular vote in one hour the prettiest woman and homeliest man present. Miss Sophia Zogg easily won the ladies' prize and H. G. Knox won the prize for men. J. W. Stone losing by only five votes. The prize in each case was cake, ice cream, cake and watermelons were served. The church lawn was decorated with electric lights.

The fourth quarterly conference of the Methodist church for the Boring-Pleasant Home charge will be held at Pleasant Home next Thursday afternoon at 2:30 o'clock, the Rev. T. B. Ford, of Salem, district superintendent presiding.

IF ECONOMICAL COUNTY-LAID PAVING IS SUCCESS, SAY FAREWELL TO CONTRACTORS

COST OF CLACKAMAS' HARD SURFACE IS COMPARED WITH PAVING LAID BY MULTNOMAH UNDER CONTRACT.

(By A. H. Harris.)

Clackamas county's first experiment in constructing hard surface roads without the intervention of contractors and without paying profits for "know how," is bringing forth criticisms as well as compliments, and some of the criticism comes from men who represent themselves as good roads enthusiasts. A. S. Benson, who has been active in boosting for the Columbia river highway, and who has been working with S. Benson and J. B. Yeoh, in highway construction plans, has announced his belief that the work is cheap and shoddy. Mr. Benson seems to realize that the work, if it proves of good quality, will ultimately mean the abandonment of the contract system of road construction in Oregon and the death knell to tremendous profits which have been made in the paving game.

I had hoped that Mr. Benson was big enough to forget the profits which his friend might make in the contracting game, and consider the highway experiment in Clackamas county on its merits. Any loyal citizen of Oregon, who is not directly nor indirectly interested in the paving game, should be fair enough to do that.

The figures which were printed in my recent article on highway construction were not startling to any body not interested in the paving game, either directly or indirectly. It was only the tendency, the clearly shown tendency, which the facts established, that could send a shiver into the bones of the contractor or his friends. The story showed that prices of paving had been too high; that the claims made on account of the alleged payments to labor were dishonest and misleading; that the profits made have been out of reason. In other words, there is a fear, clearly expressed in the position of Mr. Benson, that the contracting game cannot succeed much further if a little county like Clackamas can build its own roads for half the prices charged or attempted to be charged by contractors in the same profits.

Paving is of Standard Quality. The roadway considered in my article lies south of the Clackamas river, and is not near Milwaukie, as Mr. Benson infers. The highway is known as the Parkplace road, and is 7,020 feet in length. The cost figured \$9,208 per mile, complete, while the pavement cost \$8,276 per mile. The pavement is 16 feet wide except at curves, and at the railway crossing, where the width is 20 feet. The cost of grading, was 98 1/2 cents per square yard.

Any man who claims the pavement is bad has but to go to Oregon City and inspect the roadway and the streets of the city. The streets of

Oregon City were paved with the same plant and the work was done under the same specifications and by the same superintendent of construction. The work is uniform so far as it is possible to make pavement uniform. Nobody has complained of the quality of Oregon City pavement.

In Portland in recent years East Twelfth street was paved at a cost of \$1.94 per square yard, and by a contracting concern, too. The work at Parkplace cost 98 1/2 cents per square yard, and no contractor took profits from it. The showing is not strongly in favor of the highway work as against the street work.

To me the experiment in Clackamas county means, if it means anything, a breaking away from the spoils system in road building, and I am of the opinion since reading Mr. Benson's condemnation of it, that he sees the end of the contracting system in the ultimate success of direct construction by the counties of the state. There are men in Oregon who contemplate making millions of dollars in the coming decade in the contracting game, following up the purpose of the people to build hard surface highways. If the counties can do the work as well and as cheaply as Clackamas seems to have done the contractor who wants three prices for his work is likely to have hard sledding. I assume that Mr. Benson had seen that angle of the situation before he wrote the letter making fun of the highway work being done directly by a municipality.

Paving Costs Compared. In my article of August 4 I made no comparisons of the costs of paving. It was my purpose to deal with the experiment as an experiment. I am not a highway expert, and I have been able to find but few highway experts in Multnomah county. I have been able to find many self-constituted road experts and men who have "investigated" and reported to the people statements which should have been discounted at least 100 per cent. With all the money that has been spent, with all the fuss that has been made, it has not been deemed wise to employ a commission of highway engineers to report on any phase of highway construction. Meanwhile the county has had plenty of self-constituted leadership and plenty of non-expert advice in the expenditure of millions of dollars of road funds.

But, take a look at the figures for the Columbia river highway. The length of the highway is 26 1/2 miles. The cost of paving the highway was \$18,112.30 per mile, as against \$8,276 per mile for the Clackamas county road. Of course, it is only fair to say that the quality of the roads should not be equal. The highway is a scenic drive and should have been better built than a common farmers' road. The cost of construction of the Columbia river highway, the preparation of the roadbed for paving, amounted to \$29,916 per mile.

What Happened to Sandy Road. While it is not fair to make com-

A. H. HARRIS FORESEES IMPORTANT POSSIBILITIES IN "EXPERIMENTS" OF THIS COUNTY.

parisons between a road to be used by farmers and a highway to be used by motor drivers, it might be fair to make a comparison between the work done on Sandy road and the work done at Parkplace. Section "A" of Sandy road, which was paved last year under contract by the Warren Construction company, is 11.72 miles in length, extending from the eastern limits of the city of Portland. The contract for the paving of this road called for the payment of \$141,531.75, or \$12,075 per mile, or \$1.48 per square yard. The crushed rock on this section of road cost \$2.23 per cubic yard, while one contractor who wanted to do the work, offered to supply crushed stone for \$1.60 per cubic yard. It is fair to assume that the larger part of the difference in cost, between 98 1/2 cents paid by Clackamas county citizens for the Parkplace road and the \$1.48 paid by Multnomah county citizens for the Sandy road, was absorbed in charges for so-called royalties.

It is not my purpose here to criticize the work done on Sandy road. For all I know it is as good in quality as the pavement laid on the Columbia highway. It cost enough to be of standard quality, anyway.

Clackamas to Continue Work. An effort to put over a big bonding scheme in Clackamas county failed, and there are men in the contracting game who feel very unkindly to those who fought bitterly against the proposed bond issue. It was urged that the prices charged elsewhere, nearly \$18,000 per mile, for paving down to \$12,000 per mile, made it impossible for the county to carry on the hard surface work under the contract system. The defeat of road bonds in Oregon during the last two years has been the unpardonable sin, in the minds of certain men who have been leading the campaign for good roads—and profits.

The second experiment which Clackamas county is offering the state is a stretch of highway between Sellwood and Milwaukie. The hard surface job has been done on the same plan as the work was done at Parkplace, only the expense will show much less. Less work was done in preparing the grade, in draining the road, and in placing crushed rock. The cost figures are expected to show a great saving to the county and to be the basis upon which future road work will be done. There is little chance for the contractor to sell royalties or make profits in Clackamas county, now, and the indications are that there will be less after this season's experiments.

The citizens of Clackamas county are not kicking about the construction of hard surface highways without the intervention of a Portland contractor.

SILLO DEMONSTRATION AT HAZELWOOD FARM

ALL INTERESTED IN DAIRYING INVITED TO ATTEND MEETING FRIDAY.

A silo will be built in a day on the Hazelwood farm, owned by Christ Naegeli, Friday in order to show Clackamas county farmers their construction and general plan. All interested in farming and dairying are invited to attend.

The foundation for the silo is laid in advance and the material is assembled. Friday morning, under the guidance of Professor Barr of the Oregon Agricultural college, the work will begin and by nightfall it will be practically completed.

Professor Barr will explain the purpose of a silo and the best methods to use it and Judge Grant B. Dimick will probably speak. Luncheon will be served at noon.
